SCBA Mask Communications

While it seems logical to place the mic by the voice amp this is not practical as the voice amp garbles the the message and creates unclear transmission

The best method is to place the mic flat against the exhalation port, this creates less disturbance between the mic and the communicator and provides the clearest transmission of the message across the radio

Placing the mic in front of the regulator is common as this is the same procedure utilized during normal non-masked communications, the issue is the regulator can create vibration and garble
